

Problem Statement

Authors: Marcus Sostak

Problem Statement:

- People need a more efficient and valuable way of researching.

Who is experiencing the problem?

- People conducting research, such as students, academics, professionals, or anyone seeking specific information.

What is the problem?

- Researching using books and articles is time-consuming and inefficient because they often contain irrelevant information, making it difficult to find specific, related content quickly.

Where does the problem present itself?

- The problem arises in the context of traditional research methods, such as reading through books and articles, both in physical and digital formats, where navigating large amounts of content is required.

Why does the problem matter?

- The inefficiency of traditional research methods leads to wasted time and frustration. It can hinder productivity, slow down the research process, and reduce the effectiveness of learning or decision-making, especially when quick access to relevant information is needed.
